

# PLATINUM ECLIPSE™

## A Decisive Step Toward Perfection

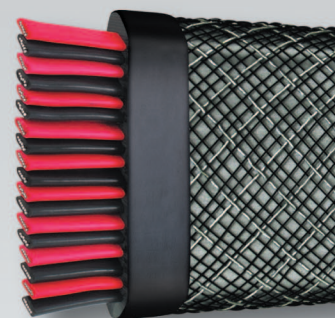

Platinum Eclipse interconnects are the first cables to utilize Wireworld's Composilex™ Technology, which makes striking improvements in sound quality by virtually eliminating the noise modulation distortion generated by conventional cable insulation materials. Composilex provides distinctly quieter backgrounds, dramatically cleaner sibilance, higher resolution, tighter image focus and wider dynamics than would be possible with the insulation materials used in other cables. The Platinum Eclipse cables make such profound sonic improvements that standard CD's take on much of the natural acoustic presence associated with the finest audiophile-grade recordings. Moreover, Platinum Eclipse cables reveal so much musical detail and expression that the finest recordings simply come to life.

Platinum Eclipse interconnects feature the world's first molded carbon fiber connectors. These elegant plugs reveal finer details and natural acoustic ambience in the sound by eliminating the eddy currents and stray field effects of conventional metal connectors, while still providing effective shielding. They also utilize Wireworld's patented silicone rubber tensioning device and silver-clad tubular OFC contacts to minimize contact losses. The Platinum Eclipse interconnect's four flat conductors are made of the finest conductor material available, Ohno Continuous Cast® solid silver of 99.99997% purity. The cable's internal structure is the same DNA Helix™ design utilized by the Wireworld's other reference interconnects, however the Platinum Eclipse conductors are substantially larger than the lesser models, providing the ultimate in resolution, soundstaging and dynamic contrasts.

The Platinum Eclipse speaker cable takes Wireworld's proprietary Diagonal DNA™ speaker cable design to an exciting new level, with eighteen flat OCC® solid silver conductors perfectly optimized and stabilized within the cable's trapezoidal profile. Each of the unique flat conductors is composed of a parallel group of six strands encased in high density polyethylene. In a dramatic departure from all previous cable designs, the conductors are stacked diagonally within the cable to create an ideal, tightly-coupled and totally parallel signal path, free from the electromagnetic field effects that filter the signal in other speaker cables. Platinum Eclipse speaker cable reveals incredible amounts of natural detail and effortless dynamics to produce the lifelike three-dimensional presentation of a live musical performance.

In addition to providing sound quality that is nearly identical to a direct connection between components, Platinum Eclipse cables preserve square wave test signals distinctly better than other high-end cables, establishing new objective benchmarks for both audible and measurable signal preservation. With the introduction of the Platinum Eclipse cables, the art of music reproduction has taken a decisive step toward perfection.

### INTERCONNECT & SPEAKER CABLE OF THE YEAR

"No cable is the be-all and end-all. But in virtually eliminating the smearing of low-level details and other anomalies that obscure resolution and cloud transparency, Platinum Eclipse represents a formidable accomplishment."

– Neil Gader, *The Absolute Sound*, October 2009

"I wasn't prepared for such fabulous detail retrieval and astonishing dynamics."

– *HiFi News*,
