

PLATINUM STARLIGHT® SILVER STARLIGHT® 6 REFERENCE STANDARD HDMI CABLES

Revolutionary 24-conductor* DNA Helix™ design** provides sublime sound and image quality

* Twice as many signal conductors as other HDMI cables

** Patent pending

In January of 2005, Wireworld introduced the world's first high-end HDMI cable, Silver Starlight 5², with aesthetic and technical virtuosity that earned a reputation as the reference standard among HDMI cables. The Platinum Starlight and Silver Starlight 6 surpass that standard with a technological breakthrough that will establish new benchmarks for HDMI cable performance for years to come.

Platinum Starlight® HDMI
Solid-silver conductors

In a dramatic departure from all previous HDMI cable designs, Platinum Starlight and Silver Starlight 6 HDMI cables employ Wireworld's new, patent-pending DNA Helix HDMI cable design, which has 24 conductors – double that of conventional HDMI cables – arranged in an innovative symmetrical geometry that reduces noise while providing a precisely balanced 100-ohm impedance at every point along the cable's length. These advantages minimize the timing errors known as digital jitter and the resulting data losses, to produce amazing improvements in sound and image quality.

Transmission speed is a dominant factor in HDMI cable performance. The transmission speed of a cable is directly related to its length and the higher speed of very short cables produces distinctly cleaner sound and sharper images. The DNA Helix HDMI cable design provides faster transmission than conventional HDMI cable designs, thus enabling standard lengths of Platinum Starlight and Silver Starlight 6 to produce lifelike sound and imaging that other cables can only match if they are made extremely short.

Silver Starlight® 6 HDMI
Silver-clad OFC conductors

The Platinum Starlight HDMI cable incorporates carbon fiber connectors and solid silver conductors in the DNA Helix design, to deliver the richest sonic textures and the most tactile images that the finest A/V systems can produce. The next best HDMI cable available is the Silver Starlight 6, which utilizes the same advanced design as the Platinum Starlight, with silver-clad OFC conductors and aluminum connectors. Both cables are capable of transfer rates above 30 Gigabits per second, far exceeding the HDMI v1.4 High Speed with Ethernet specification of 10.2 Gigabits per second. These extraordinary cables reveal an astonishing new dimension of acoustic and visual detail, bringing music, film and sporting events to life in your home.
